

Updating the operating system and software

With the network cable plugged in you should have a network connection automatically configured and ready to use (if not, you're going to have to Google how to manually set-up networking on a Pi). To update the system type:

```
sudo apt-get update
```

Wait for this to complete; it's just got a list of all the potential updates and new bits of software you could install. To upgrade all of the currently installed software type:

```
sudo apt-get upgrade
```

Wait for that to complete, answer any prompts with 'y' + Enter. Your system is now up-to-date.
